INTRODUCTION:

The currently undeveloped site is located at the intersection of Mexico Road and Sonderen Street in the City of O'Fallon, Missouri and is comprised of 5.34 acres of land. Belleau Creek runs along the north side of the site. The site was analyzed for the construction of an animal hospital. Detention and water quality were designed to meet the City of O'Fallon design standards. The dry detention basin was designed so the peak rate of runoff leaving the tract under postdeveloped conditions is less than or equal to the peak rate of runoff under predeveloped conditions for the 2, 15, 25, and 100 year 20 minute design storms. The safe passage of the 100 year 20 minute design storm was designed assuming the low flow slot is blocked while providing a minimum of 1 foot of freeboard. Water quality for the development is provided by 2 snouts, which treats stormwater runoff prior to entering the dry detention basin.

GENERAL SITE DATA AND RUNOFF CALCULATIONS

The predeveloped runoff factors used for the analysis are:

Land Use	Percent Impervious	PI Factors (cfs/ac)			
		2 year	15 year	25 year	100 year
Greenspace	0-5%	1.15	1.70	2.00	2.29

The postdeveloped runoff factors used for the analysis are:

Land Use	Percent Impervious	PI Factors (cfs/ac)			
		2 year	15 year	25 year	100 year
Greenspace	0-5%	1.15	1.70	2.00	2.29
Impervious	100%	2.39	3.54	4.16	4.77

WATER QUALITY

To ensure that sedimentation and pollution in receiving streams due to proposed additions to the site are minimized, our design will consider the water quality volume requirement as described in "Georgia Stormwater Management Manual Volumes 1, 2 and 3". Water quality volume is defined as "The storage needed to capture and treat the runoff from 90% of the recorded daily rainfall events." Water quality treatment will be provided by two snouts.

Area Treated

		Impervious Area	Pervious Area
Greenspace	0% Impervious	-	0.38 ac
Impervious	100% Impervious	0.41 ac	-
Total		0.41 ac	0.38 ac

WATER QUALITY VOLUME

$WQ_v = PR_vA/12$

Where: P = 1.14"
$R_v = 0.05 + 0.009(I)$
I = % Impervious
A = Watershed Area = 0.79 ac
A_I = Impervious Area = 0.41 ac

$I = A_I/A$
I = 0.41 ac / 0.79 ac = 0.5190 = 51.90%
$R_v = 0.05 + 0.009(51.90) = 0.5171$
$WQ_v = 1.14(0.5171)(0.79)/12 = 0.0388$ ac-ft = 1,690 ft^3

The total water quality volume for this watershed is 1,690 ft^3.

GI 103 SNOUT

Stormwater runoff entering the dry detention basin will be treated by a snout located in GI 103. This will provide water quality for the area tributary to this inlet. For a 12" pipe and a peak flow of 1.95 cfs for the 100 year 20 minute storm, an 18" Snout (Unit 18R) capable of treating a maximum flow of 3.4 cfs will be used. See calculations below for peak flow to the snout.

Greenspace	0.37 ac x	2.29 cfs/ac	=	0.85 cfs
Impervious	0.23 ac x	4.77 cfs/ac	=	1.10 cfs
		Total	=	1.95 cfs

The sump depth should be a minimum of 3 ft for a 12" RCP. We are proposing a 3' sump to prevent sediment resuspension as recommended by the manufacturer.

The structure surface area shall be at least 6 to 7 times the flow area of the outfall pipe. For a 2 grate inlet, the surface area measures 30 in by 30 in. This equates to 6.25 ft^2 of structure area. The structure area is approximately 8 times larger than the 0.79 ft^2 flow area of the pipe.

The sump of the structure will provide 37.71 ft^3 of sediment storage volume.

GI 106 SNOUT

Stormwater runoff entering the dry detention basin will be treated by a snout located in GI 106. This will provide water quality for the area tributary to this inlet. For a 12" pipe and a peak flow of 0.88 cfs for the 100 year 20 minute storm, an 18" Snout (Unit 18R) capable of treating a maximum flow of 3.4 cfs will be used. See calculation below for peak flow to the snout.

Greenspace	0.01 ac x	2.29 cfs/ac	=	0.02 cfs
Impervious	0.18 ac x	4.77 cfs/ac	=	0.86 cfs
		Total	=	0.88 cfs

The sump depth should be a minimum of 3 ft for a 12" RCP. We are proposing a 3' sump to prevent sediment resuspension as recommended by the manufacturer.

The structure surface area shall be at least 6 to 7 times the flow area of the outfall pipe. For a 2 grate inlet, the surface area measures 30 in by 30 in. This equates to 6.25 ft^2 of structure area. The structure area is approximately 8 times larger than the 0.79 ft^2 flow area of the pipe.

The sump of the structure will provide 37.71 ft^3 of sediment storage volume.

DETENTION CALCULATIONS

PREDEVELOPED CONDITIONS:

There is one watershed (watershed A) to be analyzed for the total runoff from the site for the predeveloped conditions. Using the rational method to calculate the predeveloped runoff rates leaving the site, the predeveloped runoff for the 2, 15, 25, and 100 year 20 minute design storms was calculated for comparison to the postdeveloped runoff to determine the quantity of detention that will be required.

Watershed A

Stormwater runoff in Watershed A flows overland and discharges into Belleau Creek, located along the north area of the site.

2 Year				
Onsite Greenspace	5.34 ac	x 1.15 cfs/ac	=	6.14 cfs
15 Year				
Onsite Greenspace	5.34 ac	x 1.70 cfs/ac	=	9.08 cfs
25 Year				
Onsite Greenspace	5.34 ac	x 2.00 cfs/ac	=	10.68 cfs
100 Year				
Onsite Greenspace	5.34 ac	x 2.29 cfs/ac	=	12.23 cfs

2 year-20 minute storm:	6.14 cfs
15 year-20 minute storm:	9.08 cfs
25 year-20 minute storm:	10.68 cfs
100 year-20 minute storm:	12.23 cfs

POSTDEVELOPED CONDITIONS:

The postdeveloped site maintains the same watershed as described in the predeveloped conditions. For this analysis, the postdeveloped runoff for the 2, 15, 25, and 100 year 20 minute design storms was calculated for comparison to the previously calculated predeveloped runoff to calculate the quantity of detention that will be required.

Postdeveloped Watershed A

2 Year				
Onsite Greenspace	4.80 ac	x	1.15 cfs/ac	= 5.52 cfs
Onsite Impervious	0.54 ac	x	2.39 cfs/ac	= 1.29 cfs
			Total	= 6.81 cfs
15 Year				
Onsite Greenspace	4.80 ac	x	1.70 cfs/ac	= 8.16 cfs
Onsite Impervious	0.54 ac	x	3.54 cfs/ac	= 1.91 cfs
			Total	= 10.07 cfs
25 Year				
Onsite Greenspace	4.80 ac	x	2.00 cfs/ac	= 9.60 cfs
Onsite Impervious	0.54 ac	x	4.16 cfs/ac	= 2.25 cfs
			Total	= 11.85 cfs
100 Year				
Onsite Greenspace	4.80 ac	x	2.29 cfs/ac	= 10.99 cfs
Onsite Impervious	0.54 ac	x	4.77 cfs/ac	= 2.58 cfs
			Total	= 13.57 cfs

2 year-20 minute storm:	6.81 cfs
15 year-20 minute storm:	10.07 cfs
25 year-20 minute storm:	11.85 cfs
100 year-20 minute storm:	13.57 cfs

DIFFERENTIAL RUNOFF

The differential runoff is calculated by subtracting the predeveloped runoff from the postdeveloped runoff. A differential runoff of 1 cfs or more requires stormwater detention within that watershed.

Watershed A

Design Storm	Postdeveloped Runoff (cfs)	Predeveloped Runoff (cfs)	Differential Runoff (cfs)
2 Year	6.81	6.14	0.67
15 Year	10.07	9.08	0.99
25 Year	11.85	10.68	1.17
100 Year	13.57	12.23	1.34

Detention is required in Watershed A.

Basin A Peak Inflow

2 Year				
Onsite Greenspace	0.47 ac	x 1.15 cfs/ac	=	0.54 cfs
Onsite Impervious	0.46 ac	x 2.39 cfs/ac	=	1.10 cfs
		Total	=	1.64 cfs
15 Year				
Onsite Greenspace	0.47 ac	x 1.70 cfs/ac	=	0.80 cfs
Onsite Impervious	0.46 ac	x 3.54 cfs/ac	=	1.63 cfs
		Total	=	2.43 cfs
25 Year				
Onsite Greenspace	0.47 ac	x 2.00 cfs/ac	=	0.94 cfs
Onsite Impervious	0.46 ac	x 4.16 cfs/ac	=	1.91 cfs
		Total	=	2.85 cfs
100 Year				
Onsite Greenspace	0.47 ac	x 2.29 cfs/ac	=	1.08 cfs
Onsite Impervious	0.46 ac	x 4.77 cfs/ac	=	2.19 cfs
		Total	=	3.27 cfs

2 year-20 minute storm:	1.64 cfs
15 year-20 minute storm:	2.43 cfs
25 year-20 minute storm:	2.85 cfs
100 year-20 minute storm:	3.27 cfs

TIME OF CONCENTRATION:

Time of concentration is defined as the time required for stormwater to flow from the most remote point in a watershed to the proposed dry detention basin. The most remote point on this site tributary to the dry detention basin lies on the southwestern side of the site. Stormwater travels over grass for 76 feet. Next, stormwater enters a grass swale and travels 125 feet until it enters AI 104. Stormwater then travels through the storm sewer system for 199 feet until it enters the detention basin. Time of concentration is calculated below. Note that time of concentration for stormwater that travels 76 feet over grass is considered to be 1 minute since the given parameters do not intersect the time of concentration on the attached chart which can be found in Appendix A. It was interpolated out to 0.5 minutes and with a surface coefficient of 2, the 76 foot long time of concentration path is 1 minute.

Watershed A

$T_{overland}$:

L = 76 feet
Elevation difference = 8 feet
Surface Coefficient = 2.0 (grass)

L = 125 feet
Elevation difference = 2.3 feet
Surface Coefficient = 1.0 (grass swale)

$T_{overland}$ = 1.0 min + 1.5 min * 1.0 = 2.5 minutes

$T_{storm\ sewer}$:

L = 199 feet
Average Velocity = 7 ft/s
$T_{storm\ sewer}$ = 199 feet/7 ft/s/60 sec/min = 0.47 min

Total time = 2.5 + 0.47 = 2.97 min => **use 3 minutes**

ALLOWABLE RELEASE RATE

The allowable release rate is defined as the maximum amount of stormwater that can be released from the proposed dry detention basin for a specified storm event. This calculation was performed by subtracting the differential runoff from the basin inflow. The following table shows the calculated allowable release rate for the following storm events.

Storm Frequency (20 Minute Duration)	Basin Inflow (cfs)	Differential Runoff (cfs)	Allowable Release Rate (cfs)
2 year	1.64	0.67	0.97
15 year	2.43	0.99	1.44
25 year	2.85	1.17	1.68
100 year	3.27	1.34	1.93

STORM ROUTING CALCULATIONS AND RESULTS

The computer program Pondpack was used to route the 2, 15, 25 and 100 year 20 minute storms as well as the 100 year 20 minute storm with the low flow slots blocked on the outfall structure. The routing calculations from Pondpack can be found in Appendix B. The results are detailed below.

A tailwater condition was checked during the routing calculations. The base flood elevation for Belleau Creek downstream of the site is 494.00. This elevation was set as a constant tailwater elevation for stormwater exiting the basin. However, this tailwater had no effect on detention calculations so a free outfall tailwater condition was used for detention routing calculations.

The outfall structure used to release stormwater from the dry detention basin is a precast 48” manhole with grate top.

Storm Frequency (20 Minute Duration)	Basin Inflow (cfs)	Allowable Release Rate (cfs)	Calculated Release Rate (cfs)	Peak Elevation (ft)
2 Year	1.64	0.97	0.90	513.32
15 Year	2.43	1.44	1.39	513.98
25 Year	2.85	1.68	1.65	514.24
100 Year	3.27	1.93	1.83	514.49
100 Year LFB	1.64	N/A	N/A	514.95

SEDIMENT STORAGE CALCULATIONS

The City of O'Fallon design standards require that all detention basins are designed to accommodate two years of sediment storage. To calculate sediment storage, the volume of storage was calculated at the 100 year 20 minute storm high water elevation. Using the annual sediment storage nomograph included in Appendix A of this report, the volume of sediment delivered to the detention basin over a two year period was calculated by adding the volume of sediment to the storage volume in the dry detention basin for the 100 year 20 minute storm. The crest of the outfall structure was designed to be above the volume required for the 100 year 20 minute storm and the volume required for sediment storage. The results are detailed below.

100 year 20 minute storage volume	= 2,472 ft^3
Elevation at 100 year 20 minute storage volume	= 514.49 ft
2 year sediment storage volume	= 316 ft^3
Required sediment storage volume	= 2,788 ft^3
Elevation in basin with sediment storage volume	= 514.71 ft
Crest of outfall structure	= 514.75 ft

SUMMARY

Postdeveloped Watershed A

	Peak Basin Discharge	High Water
2 Year 20 Minute Storm	0.90 cfs	513.31
15 Year 20 Minute Storm	1.39 cfs	513.98
25 Year 20 Minute Storm	1.65 cfs	514.24
100 Year 20 Minute Storm	1.83 cfs	514.49
100 Year 20 Minute LFB Storm	3.27 cfs	514.95
Outfall Structure		Precast 48” Manhole
Crest Elevation		514.75
Low Flow Slot		5” circular orifice
Flow Line		511.25
Low Flow Slot		0.33' W x 0.50' H
Flow Line		513.50 ft

Pond Volume Equations
* Incremental volume computed by the Conic Method for Reservoir Volumes.

Volume = (1/3) * (EL2 - El1) * (Area1 + Area2 + sqr(Area1 * Area2))

where:	EL1, EL2	Lower and upper elevations of the increment
	Area1, Area2	Areas computed for EL1, EL2, respectively
	Volume	Incremental volume between EL1 and EL2
