INTRODUCTION:

The currently undeveloped site is located in the City of O'Fallon, Missouri and is comprised of 6.92 acres of land. In this report, the site shall be analyzed for the construction of the proposed Grant Warehouse and Storage Lot 4 which is an industrial site. On this site, an existing Dry Detention Basin as well as the Existing Outfall Structure shall be utilized to provide the Stormwater Attenuation required by the City of O'Fallon Design Standards for the development. The storage volume and outflow rates shall be proportioned so that the peak rate of runoff leaving the tract under Postdeveloped Conditions is less than or equal to the peak rate of runoff under Predeveloped Conditions for the 2, 15, 25, and 100 Year 20 Minute Design Storms. The safe passage of the 100 Year 20 Minute Design Storm will also be analyzed assuming the low flow slot is blocked.

DETENTION BASIN CALCULATIONS

PREDEVELOPED CONDITIONS:

The Predeveloped site has two separate discharge points to be analyzed for the total runoff from the watershed using the rational method to determine the Predeveloped Runoff rates leaving the site. For this analysis, the Predeveloped Runoff for the 2, 15, 25, and 100 year 20 minute design storms will be calculated for comparison to the Postdeveloped Runoff to determine the quantity of detention that will be required.

DETENTION ANALYSIS

TIME OF CONCENTRATION:

Time of Concentration is defined as the time needed for stormwater to flow from the most remote point in a watershed to the existing Detention Facility. With that said, the most remote point of flow on this site tributary to the Detention Facility lies on the Western portion of the site near the existing parking lot. Flows will travel approximately 117 ft across Grant Industrial drive into a swale where the flow travels approximately 248 ft into an existing culvert which passes the flow under the pavement. The flow will then travel approximately 125 ft overland to the culvert where the runoff is carried approximately 104 ft to the existing Dry Detention Facility. Time of Concentration is estimated as follows:

T(overland): L = 116.64 feet
Elevation difference = 0.96 feet
Surface Coefficient = 0.40(Pavement)

T(overland) = 0.40*1.80 = 0.72 minutes:
See figure 1 in Appendix A

T(overland): L = 247.83 feet
Elevation difference = 2.74 feet
Surface Coefficient = 1.0(greenspace)

T(overland) = 1.00*3.10 = 3.10 minutes:
See figure 1 in Appendix A

T(overland): L = 124.55 feet
Elevation difference = 2.13 feet
Surface Coefficient = 1.00(Pavement)

T(overland) = 1.00*1.50 = 1.50 minutes:
See figure 1 in Appendix A

T(storm system): L = 202.97 feet
Average Velocity = 7 ft/s

T(storm system) = 202.97(ft) / 7(ft/s) / 60 (s/min) = 0.48 min

Total time = 0.72 + 3.10 + 1.40 + 0.48 = 5.70 min => **use 5 minutes**

ALLOWABLE RELEASE RATE

Allowable Release Rate is defined as the maximum amount of stormwater that can be released from the proposed basin in any given storm duration. This calculation can be done by taking the Basin Inflow and subtracting it by the Differential Runoff Rate for each design storm. The following table is the representation of the Allowable Release Rate for this site:

BASIN 1

STORM	BASIN INFLOW	-	DIFFERENTIAL RUNOFF RATE	=	ALLOWABLE RELEASE RATE
2 yr	10.23 cfs	-	7.14 cfs	=	3.09 cfs
15 yr	15.15 cfs	-	10.57 cfs	=	4.58 cfs
25 yr	17.80 cfs	-	12.41 cfs	=	5.39 cfs
100 yr	20.40 cfs	-	14.22 cfs	=	6.18 cfs

STORM ROUTING CALCULATIONS AND RESULTS

The computer program PONDPACK was used in routing the 2, 15, 25 and 100 year storms through the Existing Dry Detention Basin required for this site. The routing calculations can be found in Appendix B for the 2, 15, 25 and 100 year storms for the watershed and also the calculations for safe passage of the 100 year storms with the low flow blocked (LFB) and the basin ponded full to the top of the outfall structure. As found in the routing calculations, the results are as follows:

Basin 1

STORM (20 MIN)	PEAK INFLOW	ALLOWABLE RELEASE RATE	CALCULATED RELEASE	PEAK ELEVATION
2 yr	10.23 cfs	3.09 cfs	1.55 cfs	569.68 ft

100 yr	20.40 cfs	6.18 cfs	3.31 cfs	571.43 ft
100 yr LFB	20.40 cfs	N/A	20.31 cfs	572.65 ft

SEDIMENT STORAGE CALCULATIONS

The City of O'Fallon Design Standards require that all detention basins are designed to accommodate two years of sediment storage. This is accomplished by routing the design storms through the outfall structure and determining the 100 year, 20 minute high-water elevation. Using the annual sediment storage nomograph included in the Appendix of this report, we calculate the volume of sediment delivered to the proposed Detention Basin over a two year period. By adding the volume of sediment to the storage volume required for the 100 year, 20 minute storm, we can calculate the crest elevation of the standpipe which must be above the volume required for the 100 year, 20 minute storm and the volume required sediment storage when added together. Pond pack has been used to calculate this elevation and the results are as follows:

Basin 1

100 Year, 20 Minute Storage	= 21,684.00 ft^3
Volume Achieved at Elevation	= 571.43 ft
2 Year Sediment Storage Volume	= 1,636 ft^3
Required Storage Volume	= 23,320.00 ft^3
Volume Achieved at Elevation	= 571.62 ft
Crest of Outfall Structure and Sill	= 572.08 ft

Total Time of Concentration = $T_{Overland}$ + T_{storm} = 1.40 + 0.48 = 1.88 → USE 1.88 min.
