STORMWATER DETENTION ANALYSIS
PREPARED BY: BAX ENGINEERING

COOL SPRINGS BUSINESS PARK
CITY OF O'FALLON, MISSOURI
BAX PROJECT NO. 99-10639C
April 29, 2008

*Detention not provided for Lot 3.

INTRODUCTION

This tract of land presently consists of four buildings with gravel driveways. The proposed land use for this tract is to demolish all existing improvements and construct a business park consisting of two office/warehouse buildings and parking lot. The overall area of this tract is approximately 3.76 acres.

The purpose of this report is to analyze the existing and proposed site runoff conditions and detail the design of the proposed detention facility. The proposed detention facility will be constructed to proportion the post-developed runoff from the site to rates that are less than or equal to the existing discharge rates from the site.

The detention requirements for the City of O'Fallon require that all proposed developments provide detention for the 2 yr, 15 yr and 25 yr 20 minute design storms. Sites that are within either the Peruque or Belleau Creek watersheds must also provide detention for the 100 yr, 20 minute design storm.

GENERAL SITE AND RUNOFF CALCULATIONS

The pre-developed and post-developed P.I. factors used in the analysis are:

LAND USAGE	2 YEAR	15 YEAR	25 YEAR	100 YEAR
OPEN SPACE 5% IMPERVIOUS	1.15 CFS/AC	1.87 CFS/AC	2.31 CFS/AC	2.95 CFS/AC
PAVEMENT/BUILDINGS 100% IMPERVIOUS	2.39 CFS/AC	3.85 CFS/AC	4.75 CFS/AC	6.08 CFS/AC

Required Attenuation

The required attenuation is the amount of runoff that must be detained in the detention basin to ensure that no increase in runoff will occur under post-developed conditions. The required attenuation is the difference between the proposed runoff produced by the site, and the runoff produced under existing conditions. The required attenuation for the site is calculated as follows.

15 yr, 20 minute storm:

11.61 cfs – 7.89 cfs = 3.72 cfs

2 yr, 20 minute:	2.33 cfs
15 yr, 20 minute:	3.72 cfs
25 yr, 20 minute:	4.58 cfs
100 yr, 20 minute:	5.87 cfs

Basin Inflows

Inflows to the detention basin have been estimated from the post-developed drainage area map included with this report. Approximately 2.39 acres are tributary to the detention basin. Total basin inflows are calculated as follows.

15 yr, 20 minute storm:

0.39 ac(1.87 cfs/ac) + 2.00 ac(3.85 cfs/ac) = 8.43 cfs

2 yr, 20 minute:	5.23 cfs
15 yr, 20 minute:	8.43 cfs
25 yr, 20 minute:	10.40 cfs
100 yr, 20 minute:	13.31 cfs

Routing Results

A computer program, "Pond Pack V.10," has been used to route the required design storms through the proposed detention basin. Since the bottom of the detention basin is below the 15 yr, 20 minute hydraulic grade line of the outfall pipe a starting water surface elevation equal to the H.G.L. of the outfall pipe has been defined. The H.G.L. of the outfall pipe is approximately 472.56 as shown on the hydraulic calculations included with the construction plans. A tailwater equal to the H.G.L. has also been defined so that there is no existing outfall from the basin prior to inflow from the design storms. Please see the attached Pond Pack data summary for a detailed calculation, a summary of these results is presented here.

DESIGN STORM	BASIN PEAK INFLOW	ALLOWABLE RELEASE RATE	CALCULATED RELEASE	ELEVATION
2 YR, 20 MIN	5.23 CFS	2.90 CFS	2.66 CFS	474.83 FT
15 YR, 20 MIN	8.43 CFS	4.71 CFS	4.50 CFS	475.94 FT
25 YR, 20 MIN	10.40 CFS	5.82 CFS	5.18 CFS	476.56 FT
100 YR, 20 MIN	13.31 CFS	7.44 CFS	6.00 CFS	477.47 FT

Sediment Storage Calculations

The City of O'Fallon design standards require that all detention basins are designed to accommodate two years of sediment storage. This is accomplished by routing the design storms through the outfall structure and determining the 100 yr, 20 minute high-water elevation. Using the annual sediment storage nomograph included in the appendix of this report we calculate the volume of sediment delivered to the detention basin over a two year period. By adding the volume of sediment to the storage volume required for the 100 yr, 20 minute storm we calculate the crest elevation of the standpipe; which must be above the volume required for the 100 yr, 20 minute storm plus the volume required for sediment storage. Pond Pack has been used to calculate this elevation, please see the pond volume data included with the data output. A summary is presented below:

Description of Outfall Structure and Detention Basin

The detention basin will be an above ground dry basin with a 60" R.C.P. standpipe for an outfall structure. The standpipe will have a series of weirs and orifices cut or pre-cast into it's body to proportion the discharge to rates that are less than or equal to the existing runoff from the site. The low flow slot will be a 9"w x 6"h slot with a flow line elevation of 470.75 ft. The upper flow slot will be 7"w x 6"h with a flow line elevation of 474.85. As detailed earlier, the crest of the 60" standpipe will be at an elevation of 477.75 ft. The top of the standpipe will be equipped with a trash rack to prevent large debris from entering the outfall structure.

The outfall pipe will consist of approximately 52 feet of 30" RCP with an upper flow line of 470.55 and a lower flow line of 470.00. The outfall pipe has been sized to handle the runoff produced by the 100 yr, 20 minute design storm.

SUMMARY

2 yr, 20 min H.W.	474.83 ft.
15 yr, 20 min H.W.	475.94 ft.
25 yr, 20 min H.W.	476.56 ft.
100 yr, 20 min H.W.	477.47 ft.
100 yr, 20 min low flow blocked H.W.	478.18 ft.
LOW-FLOW OUTLET	9"W x 6"H
LOW-FLOW SILL ELEVATION	470.75 ft.
UPPER-FLOW OUTLET	7"W x 6"H
UPPER-FLOW SILL ELEVATION	474.85 ft.
EMERGENCY SPILLWAY	60" Stand Pipe
EMERGENCY SPILLWAY ELEVATION	477.75 ft.
TOP OF BERM	481.26 ft.
FREEBOARD (100 yr, 20 min LFB H.W.)	3.08 ft.

Note: Additional freeboard is provided to ensure sufficient storage volume can be provided for the future buildout of lot 3.

481.26	4330.000	4330	12079	5073	24946

POND VOLUME EQUATIONS

* Incremental volume computed by the Conic Method for Reservoir Volumes.

Volume = (1/3) * (EL2-EL1) * (Area1 + Area2 + sq.rt.(Area1*Area2))

where: EL1, EL2 = Lower and upper elevations of the increment
Area1,Area2 = Areas computed for EL1, EL2, respectively
Volume = Incremental volume between EL1 and EL2
