INTRODUCTION:

The currently undeveloped site is located in the City of O'Fallon, Missouri and is comprised of 8.748 acres of land. The site shall be analyzed for the construction of the proposed building disturbing approximately 6.27 acres of land. A dry detention basin is proposed to provide the Stormwater Attenuation required by the City of O'Fallon Design Standards for the proposed development. The Detention basin is also designed to provide detention for the potential future development on the remaining 5.92 acres on the site. The storage volume and outflow rates shall be proportioned to ensure that the peak rate of runoff leaving the tract under Postdeveloped conditions is less than or equal to the peak rate of runoff under Predeveloped conditions for the 2, 15, 25, and 100 Year 20 Minute Design Storms. The safe passage of the 100 Year 20 Minute Design Storm will also be analyzed assuming the low flow slot is blocked.

A Sand Filter located in the bottom of the dry detention basin provides water quality treatment for the current development and the potential future development.

WATER QUALITY

To ensure that sedimentation and pollution in receiving streams due to development of this site is minimized, our design will consider the Water Quality Volume requirement as described in "Georgia Stormwater Management Manual Volumes 1, 2 and 3". Water quality volume is defined as "The storage needed to capture and treat the runoff from 90% of the recorded daily rainfall events." Water Quality treatment will be provided by a sand filter.

POCKET SAND FILTER

Water Quality treatment is provided by the Pocket Sand Filter in the dry detention basin. In addition to the proposed development, the sand filter is designed to treat the potential future development.

Water quality Treatment
A Pocket Sand Filter is proposed to treat the runoff from this watershed.

Required Filter Bed Area (A_f) = (WQ_v) (d_f) / (k*(h_f+d_f)*t_f)

WQ_v,	=	7,720 ft^3	=	Total Water Quality Volume (ft^3)

Pretreatment Forebay

The pretreatment for the sand filter from the current site is provided by a water quality Snout installed in GI 102 along with additional storage volume provided within the sump of the structure.

The manufacture specifies the size of the snout based on the outflow pipe from the structure. For a 15" RCP they recommend a 24" Snout.

The sump depth should be 2.5 to 3 times the inside diameter of the outflow pipe which equates to 3.13' to 3.75'. We are proposing a 4' depth sump to add additional prevention of sediment resuspension as recommend by the manufacture.

The structure surface area shall be at least 6 to 7 times the flow area of the outfall pipe. The structure area is 12.57 ft^2 which is more than 10 times larger than the 1.23 ft^2 flow area of the pipe.

The sump of the structure will provide 50.28 ft^3 of sediment storage volume.

DIFFERENTIAL RUNOFF

The differential runoff for each discharge point is determined by subtracting the Predeveloped Runoff rate from the Postdeveloped Runoff rate. A differential runoff of 0 cfs or more requires the need for stormwater detention within that watershed.

2 Year 20 minute	11.88 cfs	8.58 cfs	3.30 cfs

25 Year 20 minute	20.66 cfs	14.92 cfs	5.74 cfs
100 Year 20 minute	23.68 cfs	17.08 cfs	6.60 cfs

Detention is required in Watershed A.

Watershed B

DISCHARGE POINT A – BASIN ROUTING

TIME OF CONCENTRATION:

Time of concentration is defined as the time needed for stormwater to flow from the most remote point in the watershed to the proposed detention basin. The most remote point of flow on this site tributary to the detention basin lies near the eastern side of the proposed bank development. Flow travels overland for 295 feet until reaching GI 104, then 570 feet via storm sewer to the discharge point in the detention basin. Time of Concentration is calculated as follows:

Watershed A

$T_{overland}$:	L = 295 feet
	Elevation difference = 3.25 feet
	Surface Coefficient = 0.4 (pavement)
	$T_{overland}$ = 3.6 min*0.4 = 1.44 minutes
$T_{storm\ sewer}$:	L = 570 feet
	Average Velocity = 7 ft/s
	$T_{storm\ sewer}$ = 570 feet/7 ft/s/60 sec/min = 1.36 min

Total time = 1.44 + 1.36= 2.80 min => **use 3 minute**

ALLOWABLE RELEASE RATE

The Allowable Release Rate is defined as the maximum amount of stormwater that can be released from the proposed basin for each storm duration. This is determined by subtracting the Differential Runoff Rate from the Basin Inflow for each design storm. The following table shows the calculated Allowable Release Rate for this site:

STORM FREQUENCY (20 MINUTE DURATION)	BASIN INFLOW	-	DIFFERENTIAL RUNOFF RATE	=	ALLOWABLE RELEASE RATE
2 YEAR	9.82 cfs	-	3.30 cfs	=	6.52 cfs
15 YEAR	14.54 cfs	-	4.89 cfs	=	9.64 cfs
25 YEAR	17.09 cfs	-	5.74 cfs	=	11.34 cfs
100 YEAR	19.58 cfs	-	6.60 cfs	=	12.98 cfs

STORM ROUTING CALCULATIONS AND RESULTS

The computer program PONDPACK was used in routing the 2, 15, 25 and 100 year storms through the dry detention basin required for this site. The routing calculations can be found in Appendix B for the 2, 15, 25 and 100 year storms for the watershed and also the calculations for safe passage of the 100 year storms with the low flow blocked (LFB) and the basin ponded full to the top of the outfall structure. As found in the routing calculations, the results are as follows:

FUTURE DEVELOPMENT

In addition to the Postdeveloped scenario, a future development with a potential building, parking stalls, pavement and sidewalk is accounted for in the design of the dry detention basin. The above described future scenario will increase the impervious area entering the dry detention basin. Therefore, the dry detention basin will be designed to reduce the additional stormwater runoff.

FUTURE DIFFERENTIAL RUNOFF

The future differential runoff is determined by subtracting the Predeveloped Runoff rate from the Future Runoff rate. A differential runoff of 0 cfs or more requires the need for stormwater detention within that watershed.

2 Year 20 minute	16.65 cfs	8.58 cfs	8.07 cfs
15 Year 20 minute	24.66 cfs	12.68 cfs	11.98 cfs

FUTURE ALLOWABLE RELEASE RATE

The Future Allowable Release Rate is defined as the maximum amount of stormwater that can be released from the proposed basin for each storm duration. This is determined by subtracting the Differential Runoff Rate from the Basin Inflow for each design storm. The following table shows the calculated Allowable Release Rate for this site:

STORM FREQUENCY (20 MINUTE DURATION)	BASIN INFLOW	-	DIFFERENTIAL RUNOFF RATE	=	ALLOWABLE RELEASE RATE
2 YEAR	14.39 cfs	-	8.07 cfs	=	6.31 cfs
15 YEAR	21.30 cfs	-	11.98 cfs	=	9.32 cfs
25 YEAR	25.04 cfs	-	14.06 cfs	=	10.98 cfs
100 YEAR	28.72 cfs	-	16.14 cfs	=	12.56 cfs

FUTURE STORM ROUTING CALCULATIONS AND RESULTS

The computer program PONDPACK was used in routing the 2, 15, 25 and 100 year storms through the dry detention basin required for this site. The routing calculations can be found in Appendix C for the 2, 15, 25 and 100 year storms for the watershed and also the calculations for safe passage of the 100 year storms with the low flow blocked (LFB) and the basin ponded full to the top of the outfall structure. As found in the routing calculations, the results are as follows:

STORM FREQUENCY (20 MINUTE DURATION)	PEAK INFLOW	ALLOWABLE RELEASE RATE	CALCULATED RELEASE RATE	PEAK ELEVATION
2 Year	14.39 cfs	6.31 cfs	1.00 cfs	576.80
15 Year	21.30 cfs	9.32 cfs	5.94 cfs	577.40
25 Year	25.04 cfs	10.98 cfs	8.96 cfs	577.67
100 Year	28.72 cfs	12.56 cfs	11.95 cfs	577.91
100 Year LFB	28.72 cfs	NA	11.95 cfs	578.79

FUTURE SEDIMENT STORAGE CALCULATIONS

The City of O'Fallon design standards require that all detention basins are designed to accommodate two years of sediment storage. The future scenario will be used to calculate sediment storage due to the increased stormwater runoff compared to the postdeveloped scenario. This is accomplished by routing the design storms through the outfall structure and determining the 100 year, 20 minute storm high-water elevation. Using the annual sediment storage nomograph included in Appendix A of this report, we calculate the volume of sediment delivered to the detention basin over a two year period. By adding the volume of sediment to the storage volume required for the 100 year, 20 minute storm, we can calculate the crest elevation of the standpipe which must be above the volume required for the 100 year, 20 minute storm and the volume required sediment storage when added together. Pondpack has been used to calculate this elevation and the results are as follows:

100 Year, 20 Minute Storage	= 29,659 ft^3
100 Year highwater elevation	= 577.91 ft
2 Year Sediment Storage Volume	= 1,275 ft^3
Required Storage Volume	= 30,934 ft^3
Volume Achieved at Elevation	= 578.01 ft
Crest of Outfall Structure and Sill	= 578.15 ft
