I EXECUTIVE SUMMARY

EXECUTIVE SUMMARY

Introduction

This report was prepared by Stock & Associates, for Progress Point Phase II, a proposed development occupying approximately 64 acres of a total developable area of approximately 156 acres. The development is located within the City of O’Fallon, St. Charles County, Missouri, and is zoned HTCD. The area is currently undeveloped and is bounded by US Highway 40/61 to the south, MO Highway K to the west, and Weldon Spring Road to the north and east. The overall site is divided into two (2) major watersheds. Phase II consists of developing the western watershed and providing a single stormwater detention basin to regulate runoff.

Existing Site Description

The overall site is divided into two watersheds with slightly more than half the site sloping northwest towards Crooked Creek, and the remainder of the site sloping northeast towards Weldon Spring Road and Persimmon Woods Golf Course. A portion of the area tributary to Crooked Creek is the subject of this scope report.

The site is largely agricultural consisting of small grain. Woods cover a fair portion of the ground and border the fields and line the draws and creek banks. The site is gently rolling and generally falls from south to north. Runoff from this watershed drains directly into Crooked Creek.

Soil Characteristics

A soil survey map included in this report indicates the soils present on-site. The soil description is included in the appendix. Although there are some areas of soils in Hydrologic Group D, the soils are predominately within Hydrologic Group C. The on-site soils and their hydrologic groups are as follows:

<u>Soil</u>	<u>Hydrologic Group</u>
11, Dockery	C
24D2, Keswick	D
27C, Armster	C
48B, 48C, Weller	C

Proposed Improvements

The proposed development for Phase II of Progress Point includes office, retail, and food services. Infrastructure construction will comprise roads, utilities, and stormwater management facilities within the site.

In order to model runoff from the post-development condition, it is necessary to know the amount of impervious cover. Since the exact proportions of pavement, roofs, and vegetated areas are not known at this time, we assumed 90% impervious cover in the developed condition as stipulated by the City of O’Fallon. In the future, as final build-out becomes imminent, the proportion of impervious coverage will need to be accurately determined and the design solutions validated or adjusted as required.

Hydrologic Methodology and Results

Hydrologic calculations for this report were done using Haestad Methods QTR55 computer modeling software. Runoff rates were calculated for both the existing and proposed conditions for the 2, 15, 25, and 100 year storms. Haestad Methods PondPack v8 was used to hydraulically model the post-development conditions and route runoff from the various storms through the proposed detention basin and outlet control structure.

Three areas of the project will not drain to the detention basin, and runoff from these three areas will be released undetained. These comprise a 10 acre sub-area to the west of Crooked Creek, a small sub-area of about six acres to the east of Crooked Creek adjacent to Highway 40, and a small sub-area of about two acres at the north corner of the site by Weldon Spring Road. Runoff from these three sub-areas is accounted for in the calculations by comparing the composite post-development hydrograph with the composite pre-development hydrograph. In this way, adequate volume is provided in the detention basin to attenuate the increase in runoff regardless of whether a given sub-area drains to the detention basin or not.

A single concrete outlet control structure will serve as the principal spillway. The outlet control structure and outfall piping will convey all design flows to Crooked Creek. Even though an embankment spillway is not required in order to handle design flows, an emergency overflow spillway will be cut in the embankment. The crest elevation of the emergency overflow spillway will be set higher than the highest design water surface elevation.

According to the City of O'Fallon's Land Development Regulations, Section 405.24, all new developments shall provide a storm water system that insures that the rate of flow of storm water runoff discharged from the site after development, does not exceed the rate of flow of storm water runoff discharged from the site before development, for a twenty-five (25) year storm. In compliance with stipulated requirements, we have included calculations for the 15, 25, and 100 year storms, and for the 2 year storm at the direction of the City of O'Fallon.

The following tables illustrate compliance with these regulations.

The hydraulic analysis we performed to route the 100 year storm through the detention basin show that approximately **##** ft of freeboard is provided from water surface elevation to the top of the embankment for the 100-year storm.

POND VOLUME EQUATIONS

* Incremental volume computed by the Conic Method for Reservoir Volumes.

$$\text{Volume} = (1/3) * (\text{EL2}-\text{EL1}) * (\text{Area1} + \text{Area2} + \text{sq.rt.}(\text{Area1}*\text{Area2}))$$

where: EL1, EL2 = Lower and upper elevations of the increment
Area1,Area2 = Areas computed for EL1, EL2, respectively
Volume = Incremental volume between EL1 and EL2

PRECIPITATION: -----

Column (1): Time for time step t

Column (2): $D(t)$ = Point on distribution curve for time step tColumn (3): $P_i(t) = P_a(t) - P_a(t-1)$: Col.(4) - Preceding Col.(4)Column (4): $P_a(t) = D(t) \times P$: Col.(2) \times P

PERVIOUS AREA RUNOFF (using SCS Runoff CN Method) -----

Column (5): $R_{ap}(t)$ = Accumulated pervious runoff for time step tIf ($P_a(t)$ is $\leq 0.2Sp$) then use: $R_{ap}(t) = 0.0$ If ($P_a(t)$ is $> 0.2Sp$) then use:

$$R_{ap}(t) = (Col.(4) - 0.2Sp) ** 2 / (Col.(4) + 0.85p)$$

Column (6): $R_{ip}(t)$ = Incremental pervious runoff for time step t $R_{ip}(t) = R_{ap}(t) - R_{ap}(t-1)$ $R_{ip}(t) = Col.(5)$ for current row - $Col.(5)$ for preceding row.

IMPERVIOUS AREA RUNOFF -----

Column (7 & 8)... Did not specify to use impervious areas.

INCREMENTAL WEIGHTED RUNOFF: -----

Column (9): $R(t) = (A_p/A_t) \times R_{ip}(t) + (A_i/A_t) \times R_{ii}(t)$ $R(t) = (A_p/A_t) \times Col.(6) + (A_i/A_t) \times Col.(8)$
