Lombardo Homes: The Villas at Aragon

Stormwater Management Facility Report
Executive Summary

Volz #22649

SITE INFORMATION & INTRODUCTION

The Villas at Aragon by Lombardo Homes is a proposed 98 unit development consisting of 17 buildings with the units grouped in buildings of four (4) or six (6) units per building. The total area of the development is approximately 22 acres located in St. Charles County southwest of the I-70 and TR Hughes Blvd./Belleau Creek Rd interchange. The developers have a pre-annexation agreement for the property to be annexed into the City of O'fallon. As a condition of this agreement, there will be a separate 1.00+ Ac. commercial outparcel which is to be located near Veterans Memorial Parkway to the east of the proposed entrance. Stormwater detention for the 1.00+ Ac. commercial outparcel is not accounted for with this development and therefore any future development on the commercial outparcel will be required to provide stormwater detention separately for the development.

The site is currently unoccupied having previously been developed for a trailer park community. Remnants of the previous land usage remain present on site and will be addressed during the development of this project. The site is bounded to the north by Interstate 70 and an outer road known as Drennen Parkway. The property to the east is currently undeveloped but under contract for a commercial development. The south of the site is bordered by Veterans Memorial Parkway with a commercial landscaping business and single family residential (single family homes and single family trailer park) to the south of the Parkway. The property to the west is comprised of commercial developments, specifically Garden View Care Center of O'fallon, Slumberland Furniture, and The Salvation Army of O'fallon. The project stormwater design is governed by the City of O'fallon.

There is an existing stream crossing the site flowing from the middle of the western property line to the east. Additionally, there is a 2.95'W x 1.85'H stormwater box culvert going under Veterans Memorial Parkway bringing offsite stormwater from the south onto the development property. The box culvert discharges on the north side of Veterans Memorial Parkway and from there the stormwater routes overland through a tributary to the stream crossing the property. As part of this development, the offsite stormwater will be intercepted at the north of the Parkway and routed through a 36" public storm sewer

pipe to bypass the stormwater BMP's being constructed with this development. The public storm sewer will discharge the offsite stormwater to the east of the proposed main road known as Windsong Dr. From that point, the stormwater will flow in the existing stream under the same conditions that are current in the present day.

The existing roadway to access the site off Veterans Memorial Parkway will be removed along with the two (2) existing 21" CMP pipe culverts going under the road. With this development, a new culvert is proposed to allow the stream to cross under the new road to maintain the current overall conditions of the stormwater runoff.

STORMWATER MANAGEMENT REQUIREMENTS

As previously mentioned, the total area of the site is approximately 22.0 acres with the disturbance for this development to include 19.34 acres of the total. The site currently has one main outfall/discharge point which is located near the northeast corner of the property in at the existing stream. For comparison, the discharge point used for this calculation is the two (2) 48" RCP culverts crossing under Nicola Lane. This discharge point can be referenced on the drainage area map sheets in the civil improvement plans completed by Volz inc. See the PondPack model results contained within this report for both the existing and proposed conditions as well as proposed with the low flow blocked which have been modeled and designed per stormwater requirements.

As part of this development, one (1) wet retention pond (P-2) is proposed at the middle of the development to the west of Windsong Dr. and between the existing stream and buildings 9, 10, and 11. The wet retention pond has a designed outfall structure known as OS 35 which will discharge through a 36" RCP and flared end into the existing creek. In addition to the wet retention pond, there is one (1) dry bioretention basin (F-6) proposed on the east side of the site between the eastern Windward Pl cul-de-sac and the existing creek. Similar to the wet retention pond, OS 37 is designed as the outfall structure for the dry bioretenion basin. OS 37 also discharges into the existing creek through an 18" RCP and flared end. Both stormwater BMP's are tributary to the overall site discharge point. The stormwater design is completed per the requirements adopted by the City of O'fallon and reduce the overall stormwater discharge for the 2-yr, 15-yr, 25-yr, and 100-yr rain events.

The proposed development is required to meet the City of O'fallon requirements for water quality, channel protection, and flood protection. It is noted that the City of O'fallon has largely adopted requirements and specifications as written by the St. Louis Metropolitan Sewer District (MSD). Water quality (WQv) is required due to there being greater than 1 acre of land disturbance. Channel protection (CPv) is required to be provided due to the overall site area being greater than 5 acres. Lastly the development will provide flood protection because greater than 2 cfs runoff differential is being generated by the improvements being made as part of this development. All of these conditions will be addressed with the proposed P-2 wet retention pond and F-6 dry

detention basin. The outfall point will be designed to have a net reduction in peak flow out to meet the flood protection requirement.

Once this property is developed under the proposed changes, a stormwater system will be used to capture the stormwater runoff and pipe to the proposed P-2 wet retention pond and F-6 dry detention basin. A mixture of grate inlets, curb inlets, and area inlets will be the primary components used to capture the runoff as well as surface grading to direct stormwater runoff into the proposed stormwater BMP's. As previously discussed, the offsite stormwater entering the site though the culvert going under Veterans Memorial parkway from the south will bypass all on site stormwater BMP's. This offsite stormwater from the south was omitted from the PondPack model because no offsite work is proposed which will affect the conditions offsite and therefore the existing vs/ proposed flows will remain equal. It should be noted that the stormwater runoff was calculated for the purposes of storm sewer pipe hydraulic design which was previously approved on the grading permit under GR22-000002. The proposed P-2 wet pond and F-6 dry basin will have outlet structures designed for the proposed rain events to account for the WQv and CPv storage volumes and rain event high water and discharge requirements.

STORMWATER MANAGEMENT RESULTS

The stormwater runoff as previously mentioned is handled in a proposed P-2 wet retention pond and F-6 bioretention basin. Both of these basins are sized per the Georgia Stormwater Manual Guidelines which the City of O'fallon has adopted. Under these guidelines, each BMP will be sized appropriately for WQv, CPv, 2-yr, 15-yr, 25-yr, 100-yr, and 100-yr low flow blocked design requirements. The site existing and proposed conditions have been modeled in Bentley PondPack to simulate the routing of the 2-yr, 15-yr, 25-yr, 100-yr, and 100-yr low blocked scenarios to each of the three designated outfall points on site.

Under the existing conditions, the outfall has a 2-yr rain event peak flow of 164.88 cfs and a 100-yr rain event of 565.59 cfs. Under the proposed conditions, the 2-yr peak flow is 120.58 cfs (reduction of 44.30 cfs) and the 100-yr peak flow is 458.91 cfs (reduction of 106.68 cfs). The highwater of the P-2 wet retention pond under the 100-yr rain event low flow blocked scenario is 498.69 which is 1.01' below the proposed dam spillway elevation of 499.70. The F-6 dry bioretention basin has a 100-yr rain event low flow blocked scenario is 490.38 which is 1.12' below the proposed dam spillway elevation of 491.50.

See Table 1 in this report for the complete PondPack existing and proposed conditions results summary including 15-yr and 25-yr rain even existing and proposed condition results and Table 2 for the summary of the calculated highwater elevations for both the P-2 wet retention pond and F-6 dry bioretention basin for all rain events.

Area of Land Disturbance = 19.34 Acres

Natural Resources Protection Information

An Existing Conditions Plan has been included in the improvement plans on sheet C04 for this project.

The site currently does not have any habitable structures located on the property. There is currently some pavement and cultural debris areas which remain from the previous land use which will be demolished and removed with the construction activities when developing this site. After completion of the proposed improvements, the site will consist of 98 single family residential units grouped into four (4) and six (6) unit buildings for a total of seventeen (17) separate residential buildings. An additional building will be constructed to be used as a maintenance building.

No portion of the site or work taking place as part of this redevelopment project will be within the 100-year flood plain.

The USGA soil map for this area has been included in this overall Storm Water Facilities Report. There are no known wetlands on the property.

Table 1: The Villas at Aragon - PondPack Storm Routing Results Table

Model Discharge Location	Existing PondPack Model Area	Scenario (Rain Event)	Ex. Conditions Model Outfall (cfs)	Proposed Conditions PondPack Model Area	Scenario (Rain Event)	Proposed Conditions Outfall (cfs)	Total Outfall Differential (Existing vs. Proposed)			
							2-yr Rain Event	15-yr Rain Event	25-yr Rain Event	100-yr Rain Event

TREE PRESERVATION CALCULATIONS

CITY OF O'FALLON, MO: SECTION 402.040.B

DURING DEVELOPMENT, ONCE A SITE PLAN OR PRELIMINARY PLAT APPROVAL HAS BEEN REQUESTED, A MINIMUM OF TWENTY PERCENT (20%) OF THE EXISTING TREES OR FIFTEEN TREES PER ACRE SHALL BE RETAINED.

ARAGON REQUIREMENT: RETAIN TWENTY PERCENT (20%) OF THE EXISTING TREES.

CALCULATIONS (TREES 6" CALIPER AND GREATER):

EXISTING TREES = 10.27 Ac.
TREES TO BE REMOVED = 7.59 Ac.
TREES TO BE RETAINED = 2.68 Ac.
% RETAINED = 26.10% > 20%

GENERAL NOTES:

1. CLEARING LIMITS SHALL BE VISIBLY MARKED IN THE FIELD PRIOR TO REMOVAL OF TREES.

STORMWATER MANAGEMENT SIZING CALCULATOR

PROJECT:	The Villas at Aragon	DATE:	6/29/22
CLIENT:	Lombardo Homes	JOB #	22649

WATER QUALITY VOLUME (WQv)

Knowns:

13.49	A_{Tot} = Area in Acres
6.70	A_{Imp} = Impervious Area in Acres
49.67	I = Post Developed % Impervious

1.14 P = Rainfall depth in inches

Note: 85th percentile storm event, i.e. all the runoff from 85% of the storms that occur on average during the course of a year and a portion of the runoff from all storms greater than 1.2 inches

Vol. Runoff coeff.: $Rv = 0.05 + 0.009 \times I$ = 0.50

Water quality Vol: $WQv = P \times Rv \times A_{Tot} \times 43560 / 12$

WQv = 27745 Cubic Feet

WQv provided by Wet Pond per Georgia Stormwater Manual

Volume Required: $Fv = 0.1x\ I \times A_{Imp} \times 43560 / 12$ = **2,432 CF**

FE 8 & FE 19 FOREBAY CALCULATION

Discharge Point Tributary Area:

$A_{FE\ 1}$ = 11.04 Ac.

= 81.84%

Required: $V_{FE\ 1\ Forebay}$ = 1,990 CF

Provided: $V_{FE\ 1\ Forebay}$ = 1,990 CF

Proposed $V_{FE\ 1\ Forebay}$ > Required $V_{FE\ 1\ Forebay}$ = **PASS**

VOLUME WITHIN FOREBAY

Elevation	Area (sf)	Volume (cf)	Cumulative	Notes

499.67	42,277	27,528	130,031	10' Wide Emergency Spillway

ACTUAL WATER QUALITY VOLUME (WQv) CHECK

WQv Volume Check:	PROPOSED		MINIMUM REQUIRED		
	Vp = 28,306 CF	**>**	**Vp = 27,745 CF**	**=**	**PASS**

Notes: The WQv required for the project must be calculated from the Disturbed Area. The WQv required for the P-2 Pond must be calculated from the Tributary Area

STORMWATER MANAGEMENT SIZING CALCULATOR

PROJECT:	The Villas at Aragon	DATE:	6/29/22
CLIENT:	Lombardo Homes	JOB #	22649

CHANNEL PROTECTION VOLUME (Cpv)

Knowns:

D	Soil Type
88.18	Post Developed CN
0.237	Time of Concentration (hours) - Post Developed Property
13.49	A = Area in Acres

2.50 P1 = 1-Year, 24-Hour Rainfall (inches)

S = 1000 / CN - 10 = 1.340

Initial abstraction: Ia = 0.2 x S = 0.268

Post runoff depth: Qa = [P1 - Ia]^2 / [(P1 - Ia)+S] = 1.394 inches

620 qu = Unit peak discharge (csm/inch) - Find from Figure D.11.1

Peak inflow rate: qi = qu x A x Qa = 18.22 cfs * Area is in square miles

Note: if qi < 2.0, then Cpv is not required

0.031 qo / qi = Ratio of the outflow to inflow - Find from Figure D.11.2 (Use T=24 hours)

Peak outflow rate: qo = (qo/qi) x qi = 0.565 cfs

Vs/Vr = Ratio of storage volume to runoff volume and is equal to 0.683 - 1.43(qo/qi) + 1.64(qo/qi)^2 - 0.804(qo/qi)^3 = 0.640

Vs = (Vs/Vr) x Qa = 1.0036 Acre-feet

Cpv = 43717 CF

PROVIDED POND VOLUME (ELEVATION-AREA CALCULATION)

Elevation	Area (sf)	Volume (cf)	Total Volume	Notes:
496.00	24,706	0	0	Normal water level
496.30	29,763	8,170	8,170	
497.00	32,379	21,750	29,920	
497.42	34,013	13,942	43,862	CPv Ponding Depth 1.42' (El. 497.42)
497.50	34,324	16,676	46,596	
497.51	34,676	345	46,941	
498.00	36,400	17,414	64,354	
499.00	39,897	38,149	102,503	
499.67	42,277	27,528	130,031	10' Wide Emergency Spillway

1.00 ho = Maximum storage depth associated with Vr (feet)

Required Orifice Area for Ext Det.: Ao = qo / (4.81 x ho^0.5) = 0.117 Square Feet

Required Maximum Orifice Diameter: Do = (4 x Ao / Pi)^0.5*12 = 4.64 inches

Notes: The CPv required for the project must be calculated from the Disturbed Area. The CPv required for the P-2 Pond must be calculated from the Tributary Area

STORMWATER MANAGEMENT SIZING CALCULATOR

PROJECT:	The Villas at Aragon	DATE:	6/29/22
CLIENT:	Lombardo Homes	JOB #	22649

SEDIMENT VOLUME (V_S)

Knowns: 13.49 A_{Tot} = Area in Acres

35 ft^3/year sediment per MO-DNR guidelines

V_s = 472 ft^3/year

Per City of O'fallon requirements, 2 years of sediment storage volume to be accounted for within basin.

$V_{s\ (2\ yr)}$ = 944 ft^3

Elevation	Area (sf)	Volume (cf)	Total Volume (cf)	Notes:
486.00	180	0	0	Pond Invert
487.55	1,074	972	972	2-yr Sediment Storage Depth

490.00	3,330	4,664	6,178	

F-6 Bioretention Calculator - Dry Detention Basin

PROJECT:	The Villas at Aragon	DATE:	4/18/22
CLIENT:	Lombardo Homes	JOB #	22649

WATER QUALITY VOLUME (WQv)

Knowns:

3.34	A = Site Area ((Ac)
1.14	P = Rainfall depth in inches (90% of recorded daily events)

Impervious area: 1.73 Ac

I= 51.8 %

Vol. Runoff coeff.: $R_v = 0.05 + 0.009 * I$ = 0.516

Tributary Runoff Volume: $WQ_v = P \times R_v \times A \times 43560 / 12$ = 7,134.3 CF

BIORETENTION SIZING

Knowns:

2.00	k = coefficient of permiability (ft/day) - typically 2
2.00	t_f = design filter bed drain time (days) - typically 2 days
0.40	n = porosity of filter media - typically 0.40
2.00	p = ponding depth (ft) (max height of water above filter media)
2.50	d_f = filter bed depth (ft) (2' - 4' deep)
0.75	h_f = average height of water above filter bed (ft) (p / 2)

Surface Area of Treatment Req: $A_f = [WQ_v \times d_f] / [k \times (h_f + d_f) \times t_f]$ = 1372 SF

Surface Area of Treatment Provided: A_f = 1,485 SF

Provided A_f > Required A_f = **PASS** See volume calculation below

Temporary Volume Required: $V_{Temp} = 75\% WQ_v$ = 5351 CF

Temporary Volume Provided: V_{temp} = **5,609** **CF**

Provided V_{Temp} > Required V_{Temp} = **PASS** See volume calculation below

Notes: The WQv required for the Bioretention must be calculated from the Tributary Area using a P = 1.14in for the water quality storm event.

CHANNEL PROTECTION VOLUME (Cpv)

Knowns:

D	Soil Type
89.32	Post Developed Composite CN
0.083	Time of Concentration (hours) - Post Developed Property
3.34	A = Area in Acres
2.50	P1 = 1-Year, 24-Hour Rainfall (inches)

S = 1000 / CN - 10 = 1.196

Initial abstraction: Ia = 0.2 x S = 0.239

Post runoff depth: Qa = [P1 - Ia]^2 / [(P1 - Ia)+S] = 1.479 inches

980 qu = Unit peak discharge (csm/inch) - Find from Figure D.11.1

Peak inflow rate: qi = qu x A x Qa = 7.56 cfs * Area is in square miles

Note: if qi < 2.0, then Cpv is not required

0.020 qo / qi = Ratio of the outflow to inflow - Find from Figure D.11.2 (Use T=24 hours)

Peak outflow rate: qo = (qo/qi) x qi = 0.151 cfs

Vs/Vr = Ratio of storage volume to runoff volume and is equal to 0.683 - 1.43(qo/qi) + 1.64(qo/qi)^2 - 0.804(qo/qi)^ 0.655

Vs = (Vs/Vr) x Qa = 0.2696 Acre-feet

Channel Protection Volume Required: **$CP_{V\ Req.}$ = 11,744 CF**

Channel Protection Volume Provided: **$CP_{V\ Pro.}$ = 11,832 CF** See volume calculation below

Provided CP_V > Required CP_V = **PASS**

FOREBAY SIZING

Discharge Point Tributary Area: $A_{FE\ 29}$ = 2.16 Ac.
= 64.67%

Forebay Volume Required: V_{FORE} = 25% WQ_V = 1,338 CF

FE 29 Forebay Vol. Required: = 865 CF
FE 29 Forebay Vol. Provided: = 1,060 CF

Proposed $V_{FE\ 29\ Forebay}$ > Required $V_{FE\ 29\ Forebay}$ = **PASS** See volume calculation below

HORIZONTAL SCALE: 1" = 20'
VERTICAL SCALE: 1' = 10'

P-2 Wet Retention Pond Area Maintenance Plan for The Villas at Aragon

Primary maintenance activities include vegetation management and debris and sediment removal. Routine maintenance activities, and the frequency at which they will be conducted, are shown below

No.	Routine Maintenance Task	Frequency of Task
1	If ponding water above the low flow openings remains for longer than 3 days, Clogging of the low flow openings on the outlet structure has occurred. Repair by inspecting and removing debris caught in the outlet structure openings.	As needed
2	Trim and/or remove vegetation to give the desired "shape", to prevent establishment of woody vegetation, and for mosquito control.	Twice a year (February and September)
3	Trim vegetation near the pond area or as directed by a Landscape Professional.	November through March
4	Conduct vegetation management, removing weeds and harvesting vegetation along banks. Remove all grass cuttings and other green waste.	Twice a year (February and September)
5	Remove accumulated trash and debris from the facilities and dispose of trash and debris properly.	Twice a year (February and September)
6	Remove sediment from the forebay and dispose of sediment properly.	Twice a year (February and September)
7	Inspect structural components (Overflow Drains, etc.) for cracking, subsidence, erosion and deterioration.	Twice a year, or as needed

Wet Retention Pond Design and As-built Verification Information Table

Basin ID	Design Overflow Sill Elev. (ft)*	As-built Overflow Sill Elev. (ft)*	Design Bypass/ Spill Point Elev. (ft)**	As-built Bypass/ Spill Point Elev. (ft)**	Required WQ Volume (ft^3)	Proposed WQ Volume (ft^3)	As-built WQ Volume (ft^3)	Required CP_v Volume (ft^3)	Proposed CP_v Volume (ft^3)	CP_v Provided (ft^3)
Wet Retention Pond (P-2 Wet Pond)	497.45		499.70		27,745	28,306 (El. 496.95)		43,717	43,862 (El. 497.42)	

* Overflow Sill Elevation = Maximum Water Quality Storage Elevation
** Bypass/Spill Point Elevation = Lowest adjacent elevation on the basin perimeter where overland flow would be directed.
As-built portion of table to be certified by a Professional Engineer or Professional Land Surveyor licensed in Missouri

CONSTRUCTION NOTES:

1. Concrete for the structure shall be "air entrained" and contain at least 6 sacks Class "A" Portland Cement per cubic yard. The concrete shall be placed at a slump of 4 inches +-1/2 inch. The concrete shall be proportioned and transported in accordance with ASTM C-94.
2. Reinforcing steel shall conform to ASTM C-615-60 with deformations conforming to ASTM A-305 and shall have a minimum cover of 2 inches except for 3 inches where concrete is poured against earth.
3. Laps and/or splices in reinforcing steel shall be a minimum of 30 bar diameters.
4. Keyed joints shown are to be 2-inch x 2-inch keyed construction joints.
5. fs = 24,000 psi.
6. fc = 3,750 psi.
7. All exposed edges to have a 3/4-inch chamfer.
8. Contractor to provide for bypass of stormwater during construction of structure.
9. All soil specifications shall be directed by soils engineer.

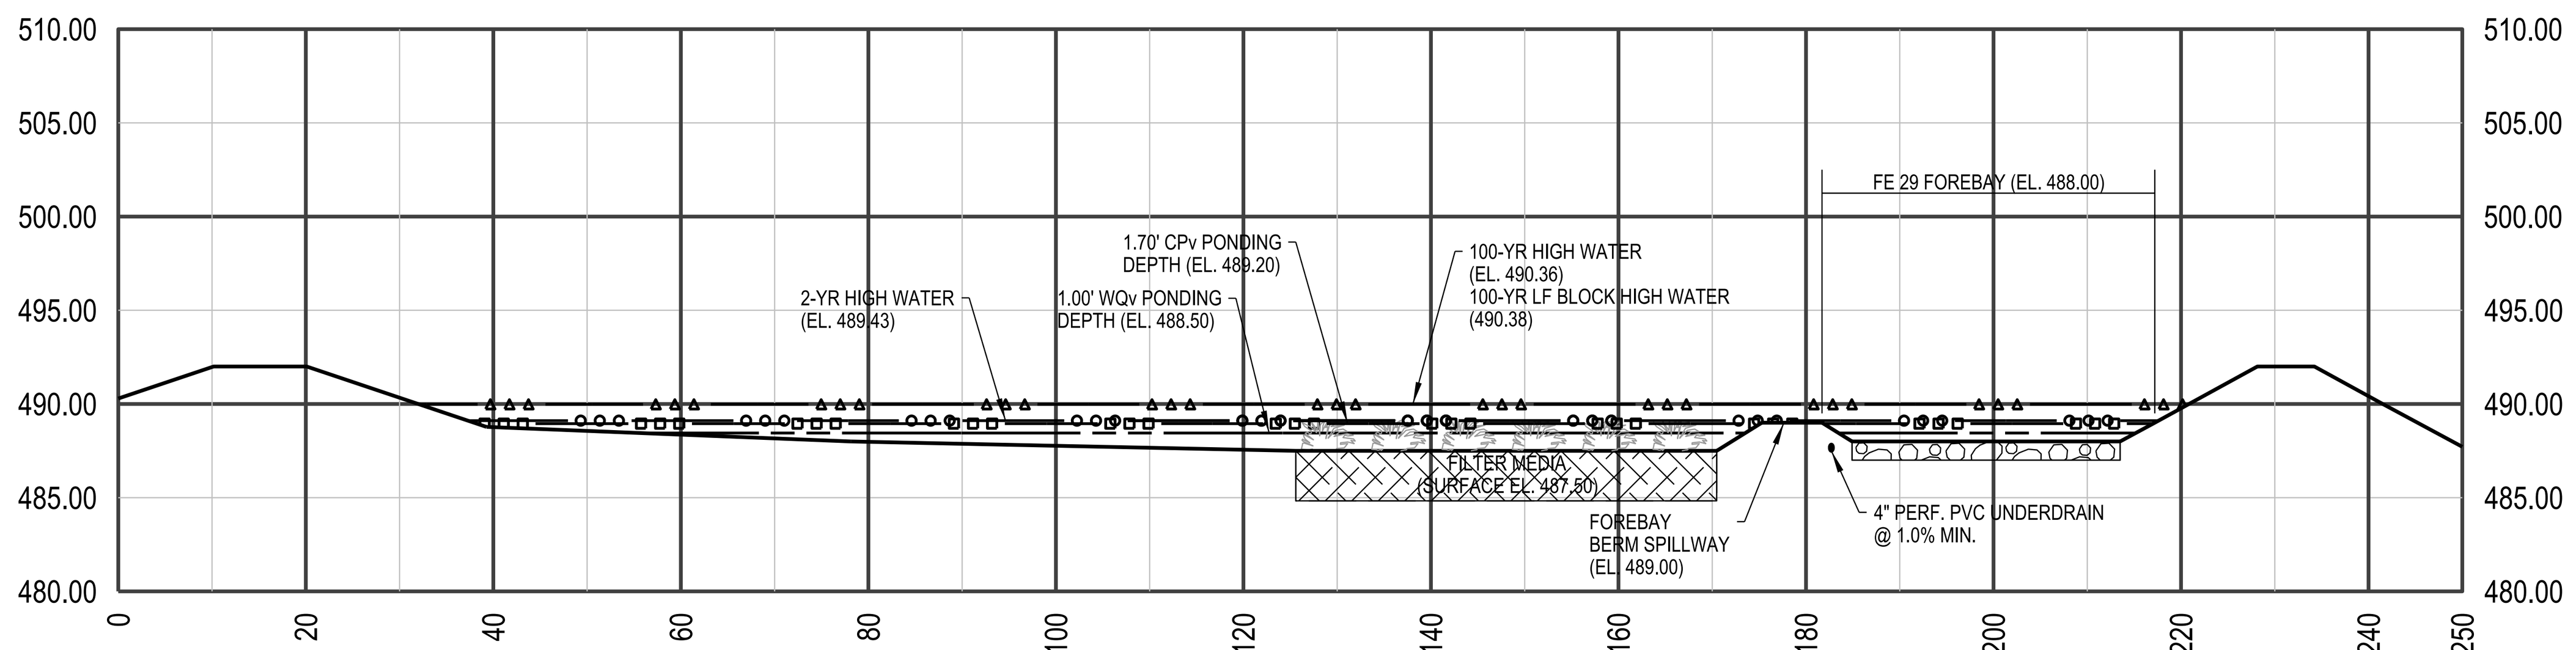
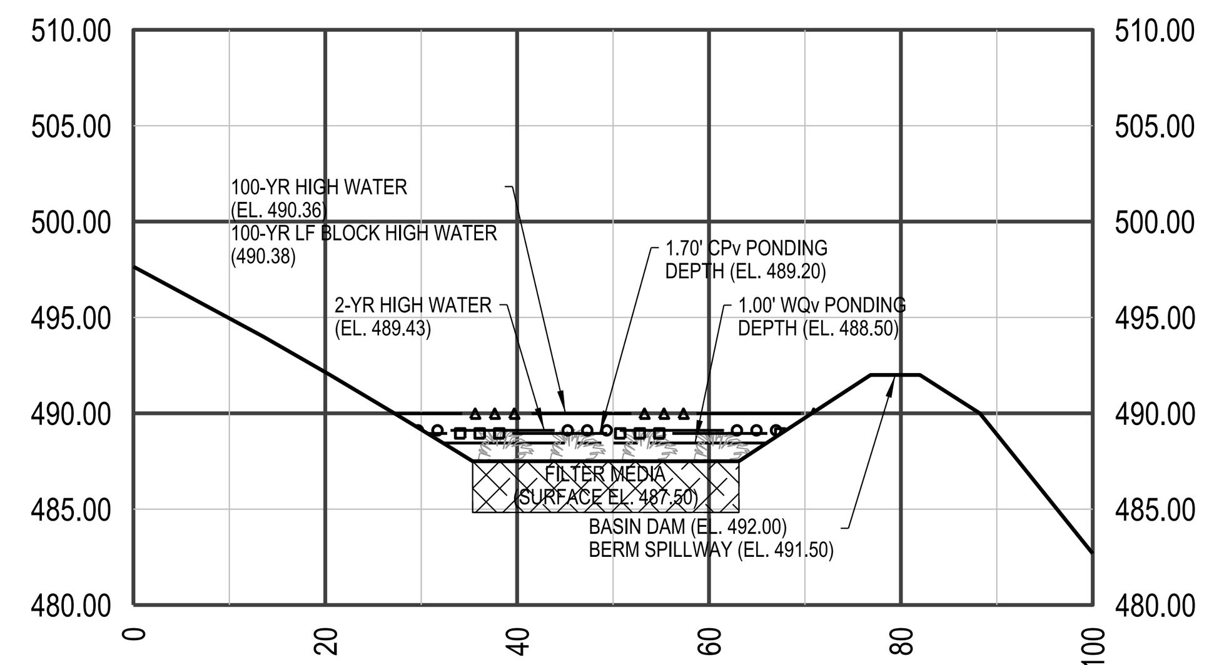
BIORETENTION (F-6) TYPICAL SECTION: DRY DETENTION BASIN

N.T.S.



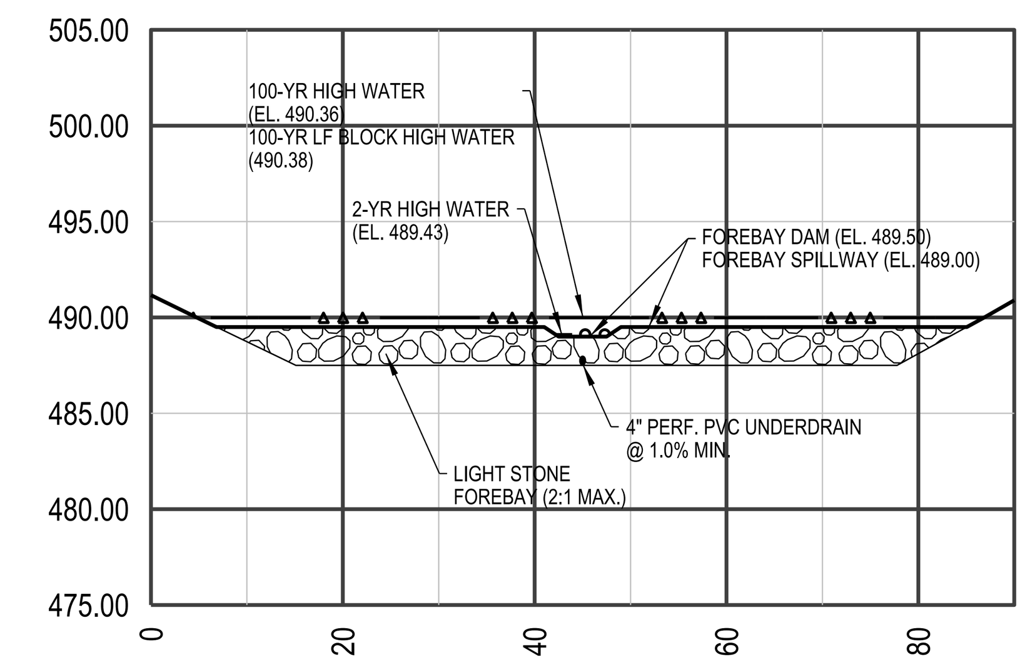
DRY BIORETENTION BASIN: SECTION 3-3

HORIZONTAL SCALE: 1" = 20'
VERTICAL SCALE: 1' = 10'



DRY BIORETENTION BASIN: SECTION 4-4

HORIZONTAL SCALE: 1" = 20'
VERTICAL SCALE: 1' = 10'



DRY BIORETENTION BASIN: SECTION 5-5

HORIZONTAL SCALE: 1" = 20'
VERTICAL SCALE: 1' = 10'

F-6 Dry Detention Basin Area Maintenance Plan for The Villas at Aragon

Primary maintenance activities include vegetation management and debris and sediment removal. Routine maintenance activities, and the frequency at which they will be conducted, are shown below

No.	Routine Maintenance Task	Frequency of Task
1	If ponding water remains for longer than 3 days, clogging of the filter media and/or underdrain has occurred. Repair by removing and replacing top layer of filter or sand media.	As needed
2	Trim and/or remove vegetation to give the desired "shape", to prevent establishment of woody vegetation, and for mosquito control.	Twice a year (February and September)
3	Trim vegetation near the basin area or as directed by a Landscape Professional.	November through March
4	Conduct vegetation management, removing weeds and harvesting vegetation. Remove all grass cuttings and other green waste.	Twice a year (February and September)
5	Remove accumulated trash and debris from the facilities and dispose of trash and debris properly.	Twice a year (February and September)
6	Remove sediment from the facilities and dispose of sediment properly.	Twice a year (February and September)
7	Inspect structural components (Overflow Drains, etc.) for cracking, subsidence, erosion and deterioration.	Twice a year, or as needed

Dry Detention Basin Design and As-built Verification Information Table

Basin ID	Design Overflow Sill Elev. (ft)*	As-built Overflow Sill Elev. (ft)*	Design Filter Surface Area (ft^2)	As-built Filter Surface Area (ft^2)	Design Filter Surface Elev. (ft)	As-built Filter Surface Elev. (ft)	Design Bypass/ Spill Point Elev. (ft)**	As-built Bypass/ Spill Point Elev. (ft)**	Required WQ Volume (ft^3)	Proposed WQ Volume (ft^3)	As-built WQ Volume (ft^3)	Required CP_v Volume (ft^3)	Proposed CP_v Volume (ft^3)	CP_v Provided (ft^3)
Dry Detention Basin (F-6 Bioretention)	489.25		1,485		487.50		489.00		5,351	5,609 (El. 488.50)		11,744	11,832 (El. 489.20)	

* Overflow Sill Elevation = Maximum Water Quality Storage Elevation
** Bypass/Spill Point Elevation = Lowest adjacent elevation on the basin perimeter where overland flow would be directed.
As-built portion of table to be certified by a Professional Engineer or Professional Land Surveyor licensed in Missouri

CONSTRUCTION NOTES:

1. Concrete for the structure shall be "air entrained" and contain at least 6 sacks Class "A" Portland Cement per cubic yard. The concrete shall be placed at a slump of 4 inches +-1/2 inch. The concrete shall be proportioned and transported in accordance with ASTM C-94.
2. Reinforcing steel shall conform to ASTM C-615-60 with deformations conforming to ASTM A-305 and shall have a minimum cover of 2 inches except for 3 inches where concrete is poured against earth.
3. Laps and/or splices in reinforcing steel shall be a minimum of 30 bar diameters.
4. Keyed joints shown are to be 2-inch x 2-inch keyed construction joints.
5. fs = 24,000 psi.
6. fc = 3,750 psi.
7. All exposed edges to have a 3/4-inch chamfer.
8. Contractor to provide for bypass of stormwater during construction of structure.
9. All soil specifications shall be directed by soils engineer.

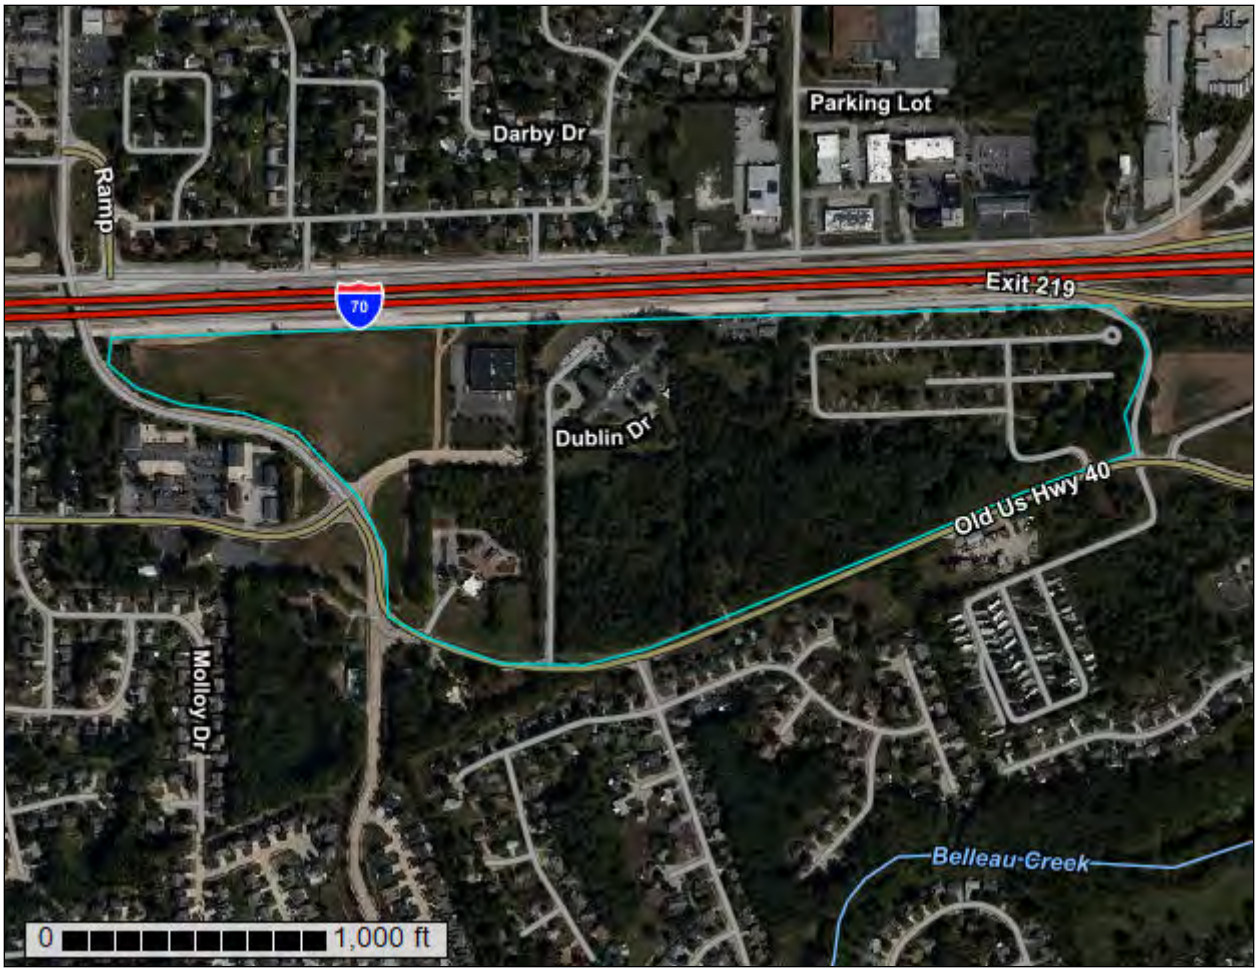
Custom Soil Resource Report for St. Charles County, Missouri

The Villas at Aragon



April 18, 2022

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

Contents

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: St. Charles County, Missouri
Survey Area Data: Version 22, Sep 7, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Sep 17, 2018—Oct 24, 2018

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
60086	Crider silt loam, 9 to 14 percent slopes, eroded	11.9	15.8%
60124	Harvester-Urban land complex, 2 to 9 percent slopes	52.2	69.3%
60125	Harvester-Urban land complex, 9 to 14 percent slopes	0.0	0.0%
60260	Weller silt loam, 5 to 9 percent slopes	10.2	13.5%
66004	Dockery silt loam, 0 to 2 percent slopes, frequently flooded	1.0	1.4%
Totals for Area of Interest		**75.4**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it

was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

St. Charles County, Missouri

60086—Crider silt loam, 9 to 14 percent slopes, eroded

Map Unit Setting

National map unit symbol: 2qp53
Elevation: 410 to 900 feet
Mean annual precipitation: 37 to 47 inches
Mean annual air temperature: 52 to 57 degrees F
Frost-free period: 184 to 228 days
Farmland classification: Farmland of statewide importance

Map Unit Composition

Crider and similar soils: 85 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Crider

Setting

Landform: Hillslopes
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Convex
Parent material: Loess over residuum weathered from dolomite

Typical profile

Ap - 0 to 11 inches: silt loam
Bt1 - 11 to 37 inches: silty clay loam
2Bt2 - 37 to 60 inches: silty clay loam

Properties and qualities

Slope: 9 to 14 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.57 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water supply, 0 to 60 inches: High (about 10.7 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 4e
Hydrologic Soil Group: C
Ecological site: F115BY005MO - Loamy Upland Woodland
Other vegetative classification: Trees/Timber (Woody Vegetation)
Hydric soil rating: No

60124—Harvester-Urban land complex, 2 to 9 percent slopes

Map Unit Setting

National map unit symbol: 6604
Elevation: 440 to 690 feet
Mean annual precipitation: 37 to 47 inches
Mean annual air temperature: 52 to 57 degrees F
Frost-free period: 184 to 228 days
Farmland classification: Farmland of statewide importance

Map Unit Composition

Harvester and similar soils: 60 percent
Urban land: 30 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Harvester

Setting

Landform: Hillslopes, ridges
Landform position (two-dimensional): Footslope, backslope, summit
Landform position (three-dimensional): Base slope, side slope, interfluve
Down-slope shape: Linear
Across-slope shape: Linear, convex
Parent material: Loess

Typical profile

C1 - 0 to 5 inches: silt loam
C2 - 5 to 80 inches: silty clay loam

Properties and qualities

Slope: 2 to 9 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Moderately well drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.14 to 0.57 in/hr)
Depth to water table: About 30 to 36 inches
Frequency of flooding: None
Frequency of ponding: None
Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water supply, 0 to 60 inches: Moderate (about 9.0 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3e
Hydrologic Soil Group: C
Ecological site: F115BY061MO - Anthropic Deep Loess Upland
Other vegetative classification: Trees/Timber (Woody Vegetation)
Hydric soil rating: No

Description of Urban Land

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8
Hydric soil rating: No

60125—Harvester-Urban land complex, 9 to 14 percent slopes

Map Unit Setting

National map unit symbol: 2qp5n
Elevation: 440 to 970 feet
Mean annual precipitation: 37 to 47 inches
Mean annual air temperature: 52 to 57 degrees F
Frost-free period: 184 to 228 days
Farmland classification: Farmland of statewide importance

Map Unit Composition

Harvester and similar soils: 70 percent
Urban land: 20 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Harvester

Setting

Landform: Hillslopes, ridges
Landform position (two-dimensional): Footslope, backslope, summit
Landform position (three-dimensional): Base slope, side slope, crest
Down-slope shape: Linear, convex
Across-slope shape: Linear, convex
Parent material: Loess

Typical profile

C1 - 0 to 5 inches: silt loam
C2 - 5 to 80 inches: silty clay loam

Properties and qualities

Slope: 9 to 14 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Moderately well drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.14 to 0.57 in/hr)
Depth to water table: About 30 to 36 inches
Frequency of flooding: None
Frequency of ponding: None
Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water supply, 0 to 60 inches: Moderate (about 9.0 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 4e
Hydrologic Soil Group: C
Ecological site: F115BY061MO - Anthropic Deep Loess Upland
Other vegetative classification: Trees/Timber (Woody Vegetation)
Hydric soil rating: No

Description of Urban Land

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8
Hydric soil rating: No

60260—Weller silt loam, 5 to 9 percent slopes

Map Unit Setting

National map unit symbol: 2qp7b
Elevation: 700 to 1,350 feet
Mean annual precipitation: 37 to 47 inches
Mean annual air temperature: 52 to 57 degrees F
Frost-free period: 184 to 228 days
Farmland classification: Farmland of statewide importance

Map Unit Composition

Weller and similar soils: 85 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Weller

Setting

Landform: Hillslopes
Landform position (two-dimensional): Shoulder
Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Convex
Parent material: Loess

Typical profile

Ap - 0 to 7 inches: silt loam
BE - 7 to 13 inches: silt loam
Bt - 13 to 47 inches: silty clay loam
Btg - 47 to 80 inches: silt loam

Properties and qualities

Slope: 5 to 9 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Moderately well drained
Runoff class: Very high

Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.20 in/hr)
Depth to water table: About 24 to 48 inches
Frequency of flooding: None
Frequency of ponding: None
Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water supply, 0 to 60 inches: High (about 10.2 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3e
Hydrologic Soil Group: D
Ecological site: F115BY001MO - Deep Loess Upland Woodland
Other vegetative classification: Trees/Timber (Woody Vegetation)
Hydric soil rating: No

66004—Dockery silt loam, 0 to 2 percent slopes, frequently flooded

Map Unit Setting

National map unit symbol: 2qp85
Elevation: 350 to 900 feet
Mean annual precipitation: 37 to 47 inches
Mean annual air temperature: 52 to 57 degrees F
Frost-free period: 184 to 228 days
Farmland classification: Not prime farmland

Map Unit Composition

Dockery and similar soils: 90 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Dockery

Setting

Landform: Flood plains
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

Ap - 0 to 10 inches: silt loam
C - 10 to 60 inches: silt loam

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Somewhat poorly drained
Runoff class: Low
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: About 18 to 30 inches
Frequency of flooding: FrequentOccasional

Frequency of ponding: None
Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)
Available water supply, 0 to 60 inches: Very high (about 12.3 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3w
Hydrologic Soil Group: B/D
Ecological site: F109XY030MO - Loamy Floodplain Forest
Other vegetative classification: Trees/Timber (Woody Vegetation)
Hydric soil rating: No

Minor Components

Racoon

Percent of map unit: 5 percent
Landform: Flood-plain steps
Down-slope shape: Linear
Across-slope shape: Linear
Other vegetative classification: Trees/Timber (Woody Vegetation)
Hydric soil rating: Yes

Dockery

Percent of map unit: 5 percent
Landform: Flood plains
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Other vegetative classification: Trees/Timber (Woody Vegetation)
Hydric soil rating: Yes
